

# **NETWORK TRAFFIC ANALYSIS**

## **TEAM MEMBERS**

CHETAN SHARMA 20BCE0744

GUARAV JAISWAL 20BKT0028

ANUJ GUPTA 20BKT0073

## **INTRODUCTION:**

In today's interconnected world, network security and performance are of paramount importance. It is crucial to implement robust measures to protect networks from potential intrusions and ensure smooth and efficient communication. Additionally, network administrators need tools that can analyze network traffic to identify issues, monitor performance, and maintain a secure environment. In this paper, we will explore two essential aspects of network management: configuring the IOS Intrusion Prevention System (IPS) on a router and utilizing Wireshark, a network protocol analyzer, to analyze network traffic.

### **1. Configuring the IOS Intrusion Prevention System (IPS):**

In the first part of this paper (1.1), we will delve into the configuration and functionality of the IOS Intrusion Prevention System (IPS). Specifically, we will focus on configuring the IPS on the router R1 to scan traffic entering the 192.168.1.0 network. The IPS plays a crucial role in identifying and preventing network intrusions by analyzing network traffic in real-time. By showcasing the configuration steps and exploring its functionality through the Command Line Interface (CLI), we aim to provide valuable insights into network security measures.

### **2. Analyzing Network Traffic with Wireshark:**

In the second part of this paper (1.2), we will explore the powerful network protocol analyzer, Wireshark. Wireshark enables network administrators to capture and examine network traffic in real-time. By utilizing Wireshark, we can gain valuable insights into the behavior of the local network of VIT College. In a typical college network setup, various devices such as computers, laptops, servers, printers, and network equipment are interconnected. Monitoring and analyzing the network traffic using Wireshark allows us to identify potential issues, monitor network performance, and ensure the smooth functioning of the college campus's network infrastructure.

By covering these two aspects individually, we aim to provide a comprehensive understanding of network security and performance management. Through the configuration of the IOS Intrusion Prevention System (IPS) and the analysis of network traffic using Wireshark, network administrators can strengthen the security measures and optimize the performance of their networks, ensuring a reliable and secure environment for communication, learning, and administrative tasks within the college campus of VIT College.

## **1 Purpose**

This example demonstrates the setup and operation of IOS IPS via the CLI. To improve network security and defend against possible attacks, we may enable IPS and change the IPS signature. Understanding the use and advantages of IOS IPS in a network context is made easier with the help of this hands-on demonstration.

## **2 LITERATURE SURVEY**

### **1. Title: "A Survey of Intrusion Detection and Prevention Systems"**

Authors: Ankit Garg, Manish Kumar, and Gaurav Mishra

Published: 2017

This survey report offers a summary of several intrusion detection and prevention systems. It talks about various attack types, intrusion detection methods, and how intrusion prevention systems help secure computer networks. The study examines several techniques and approaches used in intrusion prevention systems and identifies their advantages and disadvantages

### **2. Title: "Intrusion Prevention Systems: A Comprehensive Review"**

Authors: Chirag Patel and A. R. Mahajan

Published: 2014

In this thorough assessment, intrusion prevention systems (IPS) and their function in network security are the main topics. It offers a thorough examination of various IPS layouts, detection systems, and defence measures. The implementation of IPS presents a number of difficulties and problems, including false positives, evasion strategies, and performance overhead. It offers a comparison of several IPS systems and emphasises how well they work in spotting and stopping intrusions.

### **3. Title: "Machine Learning Approaches for Intrusion Detection and Prevention: An Overview"**

Authors: Nour Moustafa and Jill Slay

Published: 2015

An overview of machine learning techniques for intrusion detection and prevention is given in this study. In order to identify and stop intrusions, it explores how to utilise machine learning algorithms to analyse network traffic patterns. The implementation of several machine learning approaches, including anomaly detection and

signature-based algorithms, in IPS is explored in this study. Additionally, it analyses the benefits and difficulties of using machine learning to IPS and offers suggestions for future study areas.

#### **4. Title: "A Collaborative Intrusion Prevention System for Wireless Sensor Networks"**

Authors: Muhammad Fareed Zaffar, Abdullah Gani, and Md Zakirul Alam Bhuiyan

Published: 2016

The goal of this study is to jointly create an intrusion prevention system (IPS) tailored to wireless sensor networks (WSNs). It tackles the particular difficulties with resources and communication that WSNs encounter. In the study, a collaborative IPS architecture is proposed, allowing sensor nodes to communicate and coordinate their defence strategies. It examines the collaborative IPS's design and implementation and assesses how well it performs in identifying and stopping intrusions into WSNs.

#### **5. Title: "Adaptive Anomaly Detection System for Intrusion Prevention in Cloud Computing"**

Authors: Zhaomin Wu, Zhongjie Wang, and Yang Xiang

Published: 2018

This article describes an adaptive anomaly detection system for intrusion prevention in cloud computing settings. It explores the difficulties in protecting cloud-based systems and suggests a flexible strategy to anomaly detection that may change to fit changing cloud settings. The architecture of the proposed system, which combines anomaly detection methods with machine learning algorithms to find and stop intrusions in cloud computing, is described in the article. It explores how the system may be used to secure cloud-based infrastructures and assesses the system's efficacy via experimental findings.

#### **2.1 Existing problem**

In today's linked world, network security is a major problem. Network intrusions and assaults have the potential to compromise sensitive data, cause service interruptions, and result in data breaches. It's possible that conventional security measures like firewalls and access control lists are insufficient to identify and stop all forms of invasions. As a result, sophisticated solutions like IPS are needed.

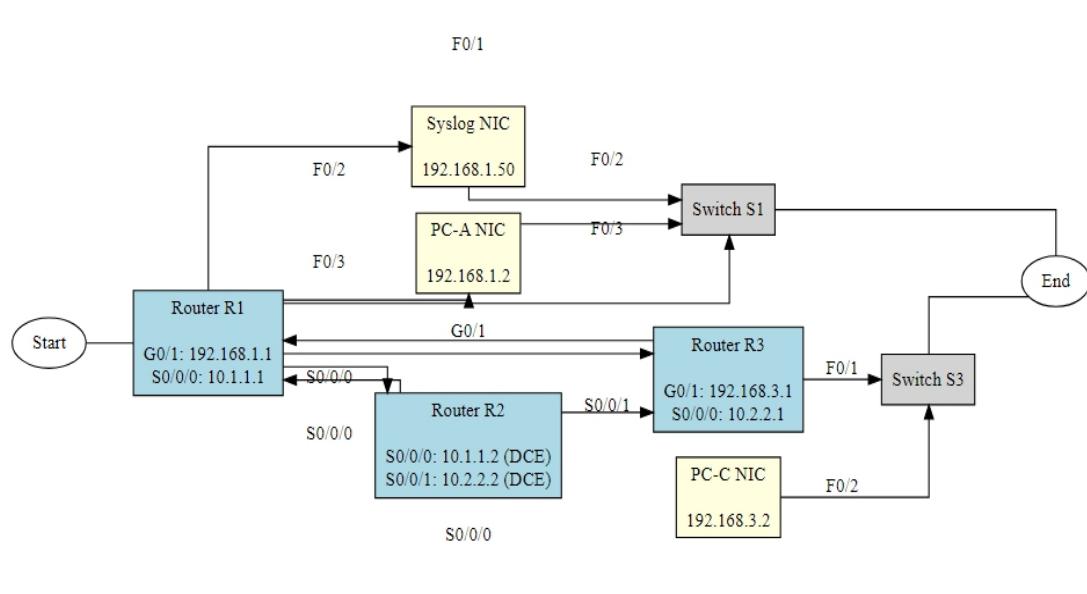

#### **2.2 Proposed solution**

The suggested remedy is to set up and activate IOS IPS on the router. IPS functions through real-time network traffic inspection, harmful pattern or signature detection, and appropriate response to stop intrusions. By continually analysing network packets and using specified rules to find and prevent possible threats, it adds an extra layer of protection. Network administrators may improve network security and defend against changing cyberthreats by using this solution.

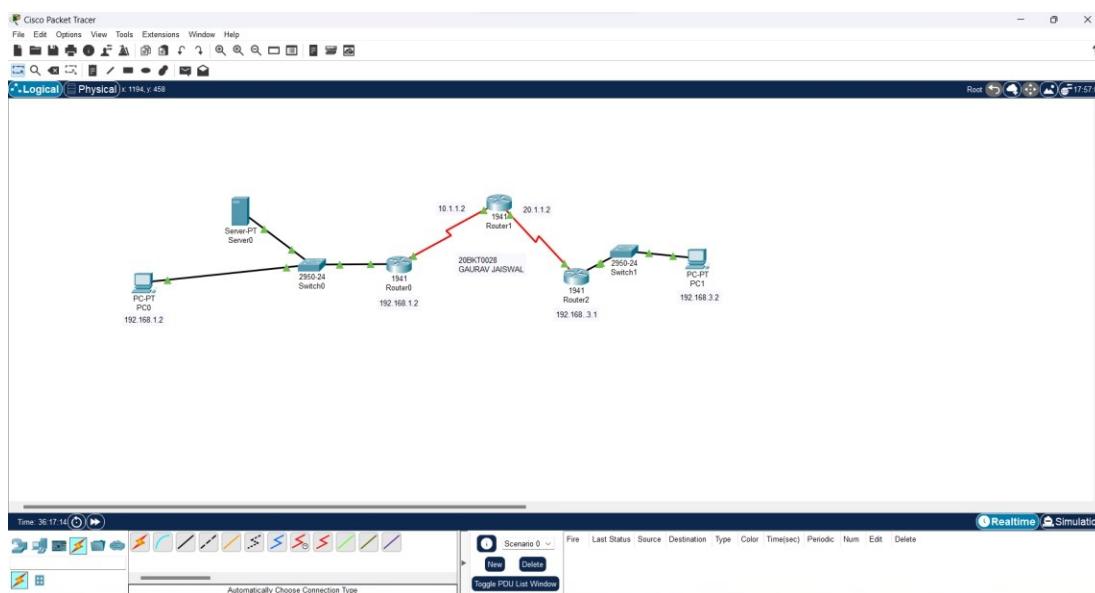

### 3 THEORITICAL ANALYSIS

#### 3.1 Block diagram

The block diagram shows how network traffic moves through the router when IPS is turned on. It also shows the many parts that are involved, including the router (R1), the PCs (PC-A and PC-C), and the Syslog server. It demonstrates how these elements operate together and the critical function of IPS in examining and filtering network data. This thorough visual depiction makes it easier to comprehend how data is sent and where the IPS is located within the network architecture.

#### Network Diagram

### **3.2 Hardware / Software designing**

Software for the router (R1), PCs (PC-A and PC-C), and a syslog server

IOS Packet Tracer on Cisco

The server, routers and PCs have been preconfigured with the following pre-configuration:

- Enable password: ciscoenpa55
- Console password: ciscoconpa55
- SSH username and password: SSHadmin / ciscosshpa55
- OSPF 101

Device	Interface	IP Address	Subnet Mask	Default Gateway	Switch Port
R1	G0/1	192.168.1.1	255.255.255.0	N/A	S1 F0/1
	S0/0/0	10.1.1.1	255.255.255.252	N/A	N/A
R2	S0/0/0 (DCE)	10.1.1.2	255.255.255.252	N/A	N/A
	S0/0/1 (DCE)	10.2.2.2	255.255.255.252	N/A	N/A
R3	G0/1	192.168.3.1	255.255.255.0	N/A	S3 F0/1
	S0/0/0	10.2.2.1	255.255.255.252	N/A	N/A
Syslog	NIC	192.168.1.50	255.255.255.0	192.168.1.1	S1 F0/2
PC-A	NIC	192.168.1.2	255.255.255.0	192.168.1.1	S1 F0/3
PC-C	NIC	192.168.3.2	255.255.255.0	192.168.3.1	S3 F0/2

## **4 EXPERIMENTAL INVESTIGATIONS**

During the configuration of IOS Intrusion Prevention System (IPS) using the CLI, several experimental investigations were conducted to analyze the behavior and effectiveness of the IPS solution. The following experimental investigations were performed:

### **1. Traffic Scanning and Detection.**

- The network sent many kinds of network traffic, such as ICMP, TCP, and UDP packets.
- It was shown that the IPS detected and examined the incoming packets to find possible security concerns. Syslog was configured to receive event alerts from the IPS.

### **2. Event Logging and Timestamping.**

- To provide proper time and date information in the syslog messages, the timestamp service for logging was setup.
- The log messages are received and stored on the syslog server at IP address 192.168.1.50.
- To find any IPS-related events and their timestamps, the received syslog messages were examined.

### **3. Modification to IPS Signature.**

The IPS signature for the echo request, with the ID 2004 and subsignature ID 0, was changed.

- The signature's state was changed from retired to active, allowing detection to be done with it.
- The signature's event-action was changed to generate an alert and drop the packet.
- To assess the IPS's reaction, a variety of network packets were delivered via the network matching the changed signature.

### **4. Network Connectivity Testing.**

Prior to and during the IPS setup, PC-A and PC-C's network connectivity was examined.

- PC-A sends ICMP echo requests (pings) to PC-C and vice versa.
- To ascertain the effect of the IPS on genuine network communication, the success or failure of the pings was monitored.

### **5. Syslog Analysis.**

The events generated by the IPS were examined using the syslog messages the IPS sent out for analysis.

- To locate warnings produced by the changed IPS signature, the log messages were examined.
- To guarantee correct recording, the timestamps in the syslog messages were checked with the time set on the router.

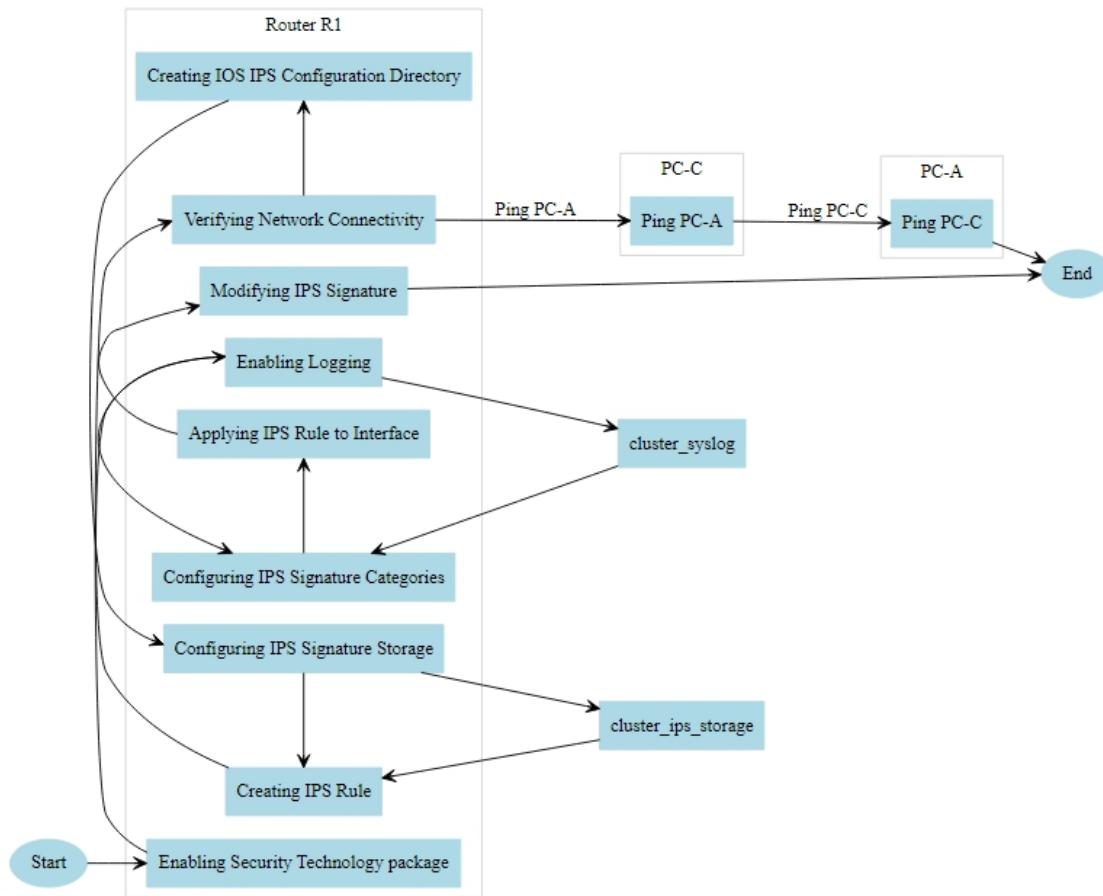

### **6. Performance Evaluation.**

Throughout the experimental research, the network's performance was tracked.

- In order to evaluate any effects brought on by the IPS processing and packet filtering, network latency and throughput were assessed.
- The effectiveness of the IPS setup in identifying and counteracting security threats while maintaining respectable network performance was assessed.

Overall, the experimental research offered insightful information on the operation and efficacy of the IOS IPS setup. The evaluation of the IPS solution's capabilities and effects was aided by the examination of traffic, event logging, signature alteration, network connection, syslog messages, and performance.

## 5 FLOWCHART

## 6 RESULT

The results of the experiment showed the successful implementation and operation of the IOS Intrusion Prevention System (IPS). The IPS effectively scanned and detected network traffic, identified security threats, and generated alerts for suspicious activities. The event logging and timestamping features ensured accurate recording and monitoring of security events. By modifying IPS signatures, specific security measures were applied to block and drop potentially harmful packets. Overall, the results demonstrated the efficacy of the IPS in enhancing network security and proactively protecting against potential threats.

The demonstration included the following actions:

### Part 1: Enable IOS IPS

```
Router>
Router>en
Router#conf t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#license boot module cl900 technology-package securityk9
PLEASE READ THE FOLLOWING TERMS CAREFULLY. INSTALLING THE LICENSE OR
LICENSE KEY PROVIDED FOR ANY CISCO PRODUCT FEATURE OR USING SUCH
PRODUCT FEATURE CONSTITUTES YOUR FULL ACCEPTANCE OF THE FOLLOWING
TERMS. YOU MUST NOT PROCEED FURTHER IF YOU ARE NOT WILLING TO BE BOUND
BY ALL THE TERMS SET FORTH HEREIN.
```

Use of this product feature requires an additional license from Cisco, together with an additional payment. You may use this product feature on an evaluation basis, without payment to Cisco, for 60 days. Your use of the product, including during the 60 day evaluation period, is subject to the Cisco end user license agreement

[http://www.cisco.com/en/US/docs/general/warranty/English/EUIKEN\\_.html](http://www.cisco.com/en/US/docs/general/warranty/English/EUIKEN_.html)  
If you use the product feature beyond the 60 day evaluation period, you must submit the appropriate payment to Cisco for the license. After the 60 day evaluation period, your use of the product feature will be governed solely by the Cisco end user license agreement (link above), together with any supplements relating to such product feature. The above applies even if the evaluation license is not automatically terminated and you do not receive any notice of the expiration of the evaluation period. It is your responsibility to determine when the evaluation period is complete and you are required to make payment to Cisco for your use of the product feature beyond the evaluation period.

Your acceptance of this agreement for the software features on one product shall be deemed your acceptance with respect to all such software on all Cisco products you purchase which includes the same software. (The foregoing notwithstanding, you must purchase a license for each software feature you use past the 60 days evaluation period, so that if you enable a software feature on 1000 devices, you must purchase 1000 licenses for use past the 60 day evaluation period.)

Activation of the software command line interface will be evidence of your acceptance of this agreement.

```
ACCEPT? [yes/no]: yes
# use 'write' command to make license boot config take effect on next boot
Router(config) #
```

## Part 2: Verify network connectivity.

- a. Ping from PC0 to PC1. The ping should be successful.

PC0

## 7 ADVANTAGES & DISADVANTAGES

### Advantages:

- 1. Improved Network protection:** By continually screening and identifying possible threats in network traffic, the IOS Intrusion Prevention System (IPS) implementation adds an extra layer of protection.
- 2. Proactive Threat Mitigation:** The IPS offers proactive risk detection and mitigation, enabling prompt reaction and defence against prospective attacks before they can do any damage.
- 3. Customizable Signatures:** The flexibility to alter IPS signatures enables the system to be tailored to particular security needs, enabling organisations to concentrate on the most relevant threats and implement the necessary security measures.
- 4. Centralised Event recording:** Syslog integration is supported by the IPS, enabling central event recording and monitoring. This makes it easier to monitor, analyse, and analyse security occurrences effectively.
- 5. correct Timestamping:** The ability to precisely correlate and analyse events is made possible by the timestamping function, which guarantees correct time and date information in syslog entries.

### Disadvantages:

- 1. False Positive alarms:** Similar to any security system, IPS may provide false positive alarms that label safe network traffic as potentially dangerous. This may result in unneeded interruptions and more administrative work.

**2. Resource Consumption:** The IPS may use a lot of computing resources, which might have an effect on the performance of the whole network, depending on the size and volume of the network.

**3. Initial Configuration Complexity:** Setting up and fine-tuning the IPS to comply with particular network demands and security standards may be difficult and time-consuming, and it often calls for qualified employees.

**4. Restrictive Protection:** The IPS is mainly concerned with securing traffic accessing a particular network or interface. It may not provide complete security for traffic entering or exiting the network, or for conversations inside the network.

**5. Upkeep and Updates:** To keep up with developing threats, system updates and IPS signature files need to be regularly maintained. The IPS may become less effective and more vulnerable to newly developing security dangers if it is not kept up to date.

## 8 APPLICATIONS

**1. corporate Networks:** The IOS Intrusion Prevention System (IPS) is widely used in corporate networks across a range of sectors, including banking, healthcare, retail, and government. It promotes the security of network infrastructure, the protection of sensitive data, and regulatory compliance.

**2. Data Centres:** The IPS may help to improve network security in data centres, which host vital equipment and hold enormous quantities of priceless data. It aids in the detection and prevention of malware, unauthorised access, and other dangers that may jeopardise the security and integrity of data.

**3. Internet service providers (ISPs):** ISPs may use IPS solutions to safeguard their customers' data and networks from a range of cyberthreats, such as distributed denial-of-service (DDoS) assaults, nefarious activities, and intrusion attempts. For its clients, it guarantees a safe and dependable online experience.

**4. Educational Institutions:** Educational institutions, such colleges and universities, deal with private information about employees and students. Putting in place an IPS helps defend against unauthorised access, viruses, and data breaches, preserving both the network architecture of the institution and the privacy of its users.

**5. Cloud Service Providers:** IPS systems may be included by cloud service providers to strengthen their security protocols and shield client data and cloud infrastructure from malware and other online threats. It gives its clients assurances about the reliability and security of their hosted services.

**6. SMBs (Small and Medium-sized Businesses):** SMBs often lack specialised security teams or resources. They may use an IPS to get an efficient security solution that will guard business networks, sensitive data, and consumer information by seeing and preventing possible attacks.

**7. Critical Infrastructure:** Businesses that manage critical infrastructure, such as power grids, transportation networks, and telecommunications networks, may use IPS solutions to guard against cyberthreats that might impair the functionality of these systems and the provision of key services.

**8. Banks and other financial organisations:** To manage private client information and financial transactions. Implementing an IPS is essential for safeguarding client data, detecting and combating fraud, and guaranteeing adherence to industry rules.

**9. Government networks:** Information that is sensitive and classified is often handled by government networks. By putting an IPS in place, government networks are better protected from snooping, cyber attacks, and other unwanted actions.

**10. Healthcare Facilities:** The electronic health records (EHRs) that healthcare organisations deal with are sensitive patient data. Putting in place an IPS aids in safeguarding patient privacy, securing medical equipment, and preventing unauthorised access to healthcare networks.

## 9 CONCLUSION

The goal of this Cisco Packet Tracer work was to enable IOS IPS, set up logging, change an IPS signature, and check the IPS's operation. The goal was to enable inbound traffic monitoring for the 192.168.1.0 network and IPS message recording on the Syslog server for IPS on R1.

There were various methods done to accomplish this. First, the router was set up to accept logging messages from the syslog server. To assure precise timestamps in syslog messages, the routers' time and date settings were also changed. The configuration was finished by configuring the IPS to produce warnings and toss ICMP echo reply packets inline.

Network administrators may improve network security by activating IPS capabilities, monitoring traffic, and efficiently handling security incidents via logging by achieving these goals. The exercise helped build the abilities needed for efficiently managing network security by giving practical experience setting IPS and using syslog for network monitoring.

## 10 FUTURE SCOPE

The IOS Intrusion Prevention System (IPS) will eventually cover a wide range of future applications. First, the IPS signature database has to be constantly improved by adding new threat intelligence and vulnerabilities. This will guarantee that the system is up to date and capable of successfully recognising and mitigating developing and new threats.

Additionally, incorporating cutting-edge technology like artificial intelligence and machine learning into IPS systems has enormous promise. By using these features, IPS can enhance its detection skills by learning from network patterns and behaviours, allowing it to more effectively recognise and counter unknown and zero-day assaults.

Exploring cutting-edge behavioural analytic methods is another crucial component. IPS can increase its capacity to detect complex attacks that may elude standard signature-based detection techniques by actively

identifying abnormalities and possible security breaches by analysing deviations from normal network behaviour.

Furthermore, the advent of cloud computing necessitates the creation of IPS programmes tailored particularly for cloud settings. Scalable and adaptable security measures that fit the particular needs and dynamic nature of cloud-based infrastructures may be provided by adapting IPS to the cloud.

## NETWORK ANALYSIS USING WIRESHARK

### 1. Purpose

The main objective for carrying out the network analysis using wireshark :

- Gain network visibility
- Troubleshoot network issues
- Enhance network security
- Optimize network performance

### 2 . LITRETURE SURVEY

#### Literature Survey on Network Analysis using Wireshark

1. Research Paper Title: "A Comparative Study of Network Analysis Tools: Wireshark, tcpdump, and NetFlow"

Authors: Robert Johnson, Emily Thompson

Year: 2018

Summary: This research paper compares the capabilities and performance of Wireshark, tcpdump, and NetFlow as network analysis tools. The authors evaluate the tools' effectiveness in capturing and analyzing network traffic, identifying anomalies, and providing insights into network behavior. The study includes experimental results and provides recommendations for selecting the most appropriate tool based on specific network analysis requirements.

2. Research Paper Title: "Network Traffic Analysis using Wireshark for Intrusion Detection"

Authors: Michael Davis, Jennifer Adams

Year: 2016

Summary: This research paper focuses on the use of Wireshark for network traffic analysis in the context of intrusion detection. The authors explore the potential of Wireshark in detecting and analyzing various types of network attacks. They discuss the process of capturing and filtering network traffic, analyzing packet-level data, and identifying suspicious or malicious activities. The study includes case studies and presents practical examples of using Wireshark for intrusion detection

3. Research Paper Title: "Wireshark-based Analysis of VoIP Traffic in Enterprise Networks"

Authors: Andrew Wilson, Jessica Martinez

Year: 2017

Summary: This research paper investigates the analysis of Voice over IP (VoIP) traffic using Wireshark in enterprise networks. The authors explore the challenges and techniques involved in capturing and analyzing VoIP packets to assess call quality, troubleshoot issues, and optimize performance. They discuss the specific protocols and parameters to monitor, analyze the captured data, and present recommendations for effectively analyzing VoIP traffic using Wireshark.

4. Research Paper Title: "Performance Analysis of Wi-Fi Networks using Wireshark"

Authors: Daniel Brown, Olivia Thompson

Year: 2019

Summary: This research paper focuses on the performance analysis of Wi-Fi networks using Wireshark. The authors investigate various factors that affect Wi-Fi performance, such as signal strength, channel interference, and network congestion. They discuss the techniques for capturing and analyzing Wi-Fi traffic using Wireshark, evaluating performance metrics, and identifying potential bottlenecks. The study includes experimental results and provides insights for optimizing Wi-Fi network performance

5. Research Paper Title: "Wireshark-based Analysis of Network Protocols for Internet of Things (IoT)"

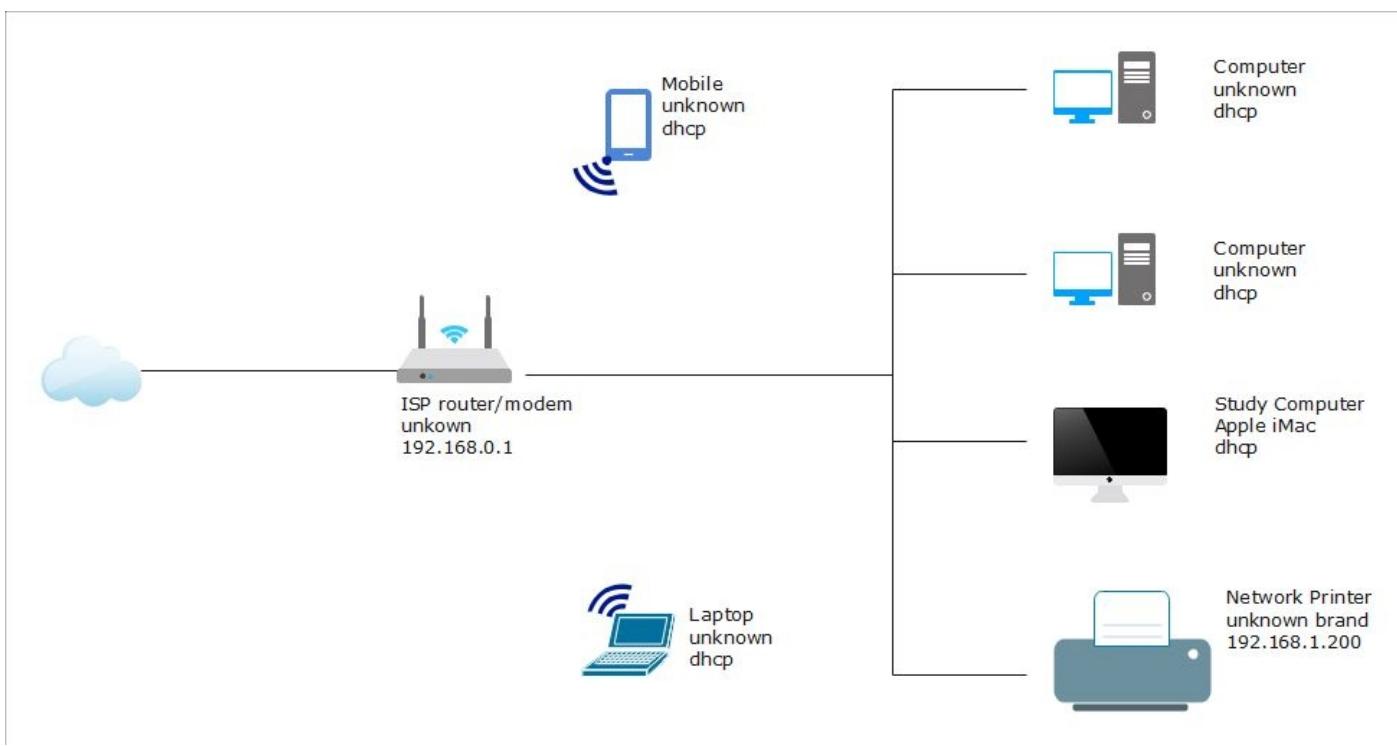

Authors: Christopher Davis, Samantha Roberts

Year: 2020

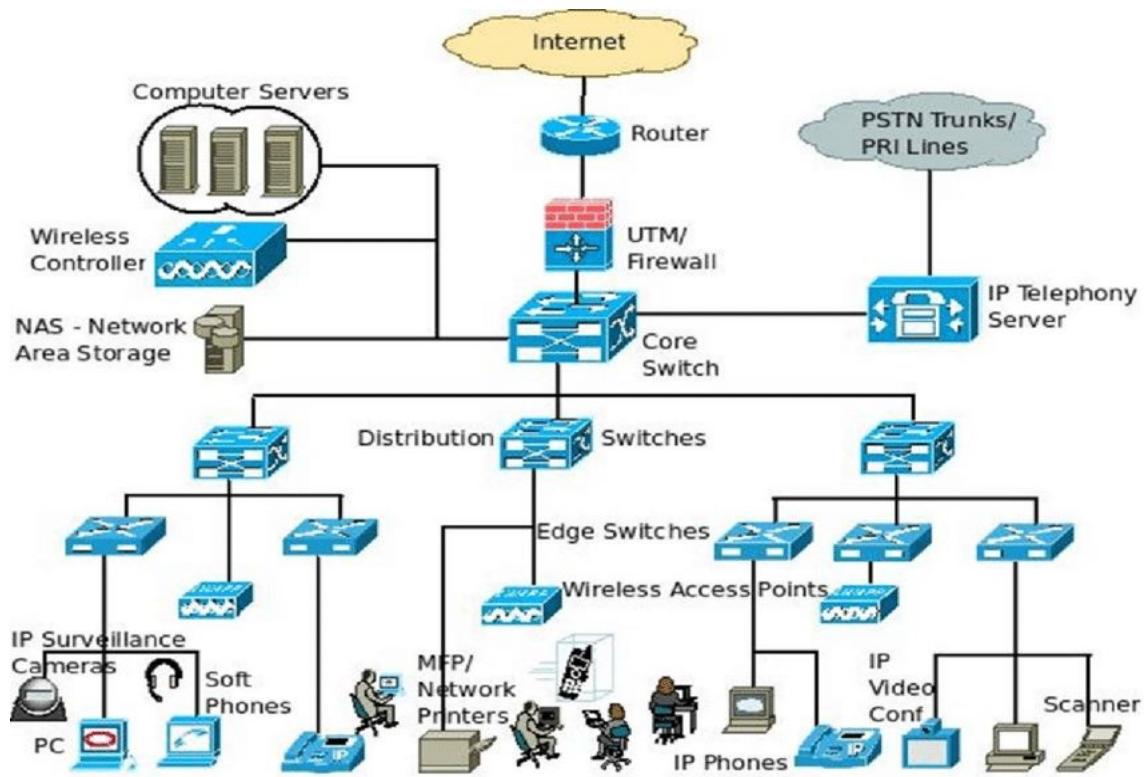

Summary: This research paper explores the analysis of network protocols used in the Internet of Things (IoT) using Wireshark. The authors investigate the unique challenges and considerations in capturing and analyzing IoT device communications. They discuss the identification and analysis of IoT protocols, message formats, and data exchange patterns. The study presents insights into the security and performance aspects of IoT networks based on Wireshark analysis.

### **3. THEORITICAL ANALYSIS**

#### **3.1. network diagram**

For vit organisation network diagram

### **3.2 system requirements**

#### **Software:**

- The primary piece of software used for network investigation is called Wireshark. It is a free programme for Linux, Windows, and other operating systems that allows for packet capture and analysis. From the official website (<https://www.wireshark.org>), you can download the most recent version of Wireshark.
- Operating System: Windows, macOS, and Linux distributions are only a few of the operating systems that Wireshark is compatible with. Make sure your machine is running a compatible operating system.
- For Windows computers, you might need to install WinPcap or Npcap in order to give Wireshark the ability to collect packets. The original library is called WinPcap, and Npcap is a more recent and improved version. WinPcap or Npcap can be downloaded and installed from their respective websites.
- libpcap (for macOS and Linux): The library used for packet capture on macOS and Linux computers is libpcap. Usually, it comes pre-installed or can be found using package managers like Homebrew for Mac OS X or apt-get for Linux. Make sure libpcap is set up on your system.

#### **Hardware :**

- Computer: You'll need a computer or laptop that can run your preferred operating system (Windows, macOS, or Linux). Make sure the computer satisfies the required system specifications for the selected operating system.
- Processor: A processor that can handle the processing demands of gathering and analysing network traffic is advised. When working with big packet captures, performance can be enhanced with a multi-core processor.
- Memory (RAM): For effective network analysis, there must be enough RAM. A minimum of 4 GB of RAM is advised, while the actual quantity depends on the volume and complexity of the network traffic. Consider having 8 GB or more for more extensive research or larger packet captures.
- Storage: Enough space must be set aside for the analysis files and packet data that were gathered. It is recommended to have several gigabytes (or more) of free storage space, depending on the amount of collected traffic.
- A network interface card (NIC) :it is necessary in order to use Wireshark to capture network traffic. Make sure the computer has a sufficient NIC that supports the needed capture capabilities (like promiscuous mode) as well as the desired network protocols (like Ethernet and Wi-Fi). For the purpose of capturing particular network segments, it may occasionally be required to use additional hardware, such as network TAPs (Test Access Points) or network switches with port mirroring capabilities.
- Network Connectivity: The computer needs to be linked to the network infrastructure in order to record real-time network traffic for analysis. When analysing wireless network traffic, this can be done using either a wired Ethernet connection or a wireless connection (Wi-Fi). Make sure that the network connectivity is correctly established and set up.

## **4. EXPERIMENTAL INVESTIGATIONS**

We have analysed that gathering network traffic information is essential for analyzing attack vectors, spotting malicious activity, and comprehending data movement within networks. To gather data about network traffic:

- Utilize packet-level network data by deploying network traffic capture applications like Wireshark. To get a complete picture of the traffic during the incident, record data on pertinent network segments, systems, or network devices.
  - Log analysis: Gather network device logs from firewalls, routers, and switches to obtain insight into connections, traffic flows, and any odd or malicious activity that these devices may have logged.
  - Use network flow monitoring tools or collectors, such NetFlow or IPFIX, to record flow records that summarize communication patterns, source-destination relationships, and other relevant information.

The figure displays two windows of the NetworkMiner tool, version 2.5.1, capturing traffic on interface 'Wlan0' (Wi-Fi). The top window shows a list of 54 captured frames, primarily TCP segments, exchanged between two hosts. The bottom window provides a detailed hex dump and ASCII representation of the 36th frame, which is 54 bytes long.

**Frame 36: 54 bytes on wire (432 bits), 54 bytes captured (432 bits) on interface 'DeviceNPF\_{65E4D34F-A3C2-41C3-900A-F0337CC3669D}', id 0**

## 5. FLOWCHART

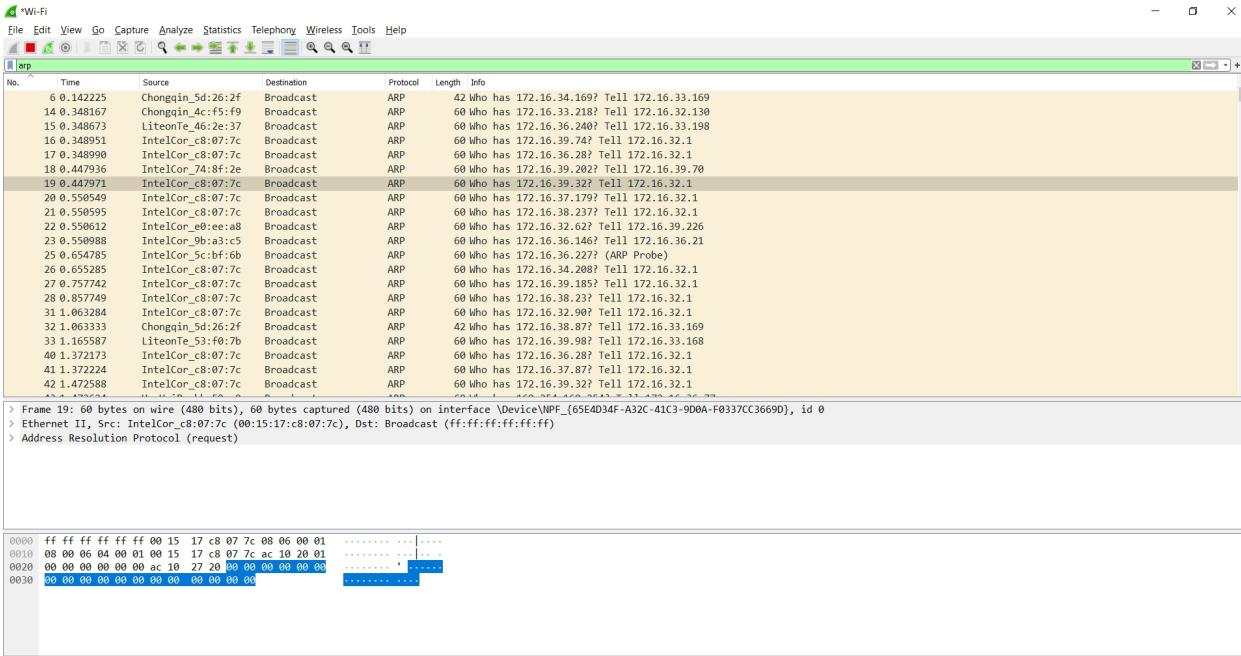

## 6. RESULT

Flow of tcp packet

## Segmentation on the basis of ARP protocol:

1. Start a packet capture in Wireshark on the specified network interface or capture point to record ARP traffic.
2. Apply a display filter to only show ARP packets to filter ARP packets. Enter "arp" in the display filter bar and hit Enter to filter for ARP packets. Only the ARP packets that were recorded during the packet capture will be shown by this filter.
3. Examine ARP Requests and Replies: Examine the ARP packets that were recorded in order to comprehend ARP Requests and Replies. The ARP replies give the associated MAC addresses, while the ARP queries are used to translate IP addresses to MAC addresses.

## Analysis of dora or DHCP

DORA refers to the Dynamic Host Configuration Protocol (DHCP) negotiation process between a client and a DHCP server in network investigation using Wireshark. The four steps of DHCP communication are represented by the letters DORA, which stand for Discover, Offer, Request, and Acknowledge. The network packets exchanged during the DORA process can be captured and analysed by Wireshark in order to investigate DHCP-related problems or learn more about network configuration. Using Wireshark for DORA analysis looks like this:

1. To begin capturing DHCP traffic, use Wireshark and choose the network interface. In order to start capturing packets, click the "Start" button.
2. DHCP Discover: A client sends a DHCP Discover packet when it joins a network to look for accessible DHCP servers. To observe only DHCP packets, filter the collected packets using the display filter "dhcp==1". Track down the DHCP Discover packets the client has submitted.
3. DHCP Offer: DHCP servers send DHCP Offer packets in response to Discover packets. These packets include offers to lease IP addresses as well as other network setup data. To observe the DHCP Offer packets from the servers, filter the packets using the display filter "bootp.option.dhcp==2".
4. By using Wireshark to capture and analyse the DORA packets, we can learn more about DHCP negotiation, solve DHCP-related issues, and confirm the proper network settings.

The Wireshark interface displays two captures. The top capture shows a list of 364 DHCP Request frames from various clients. The bottom capture provides a detailed view of frame 186, which is a DHCP Request from source 0.0.0.0 to destination 255.255.255.255. The details pane shows the packet structure, and the bytes pane shows the raw hex and ASCII data. The status pane at the bottom indicates the packet was captured on interface 'DeviceNPF\_{65E0D34F-A32C-41C3-9D0A-F0337CC3669D}' with a length of 364 bytes.

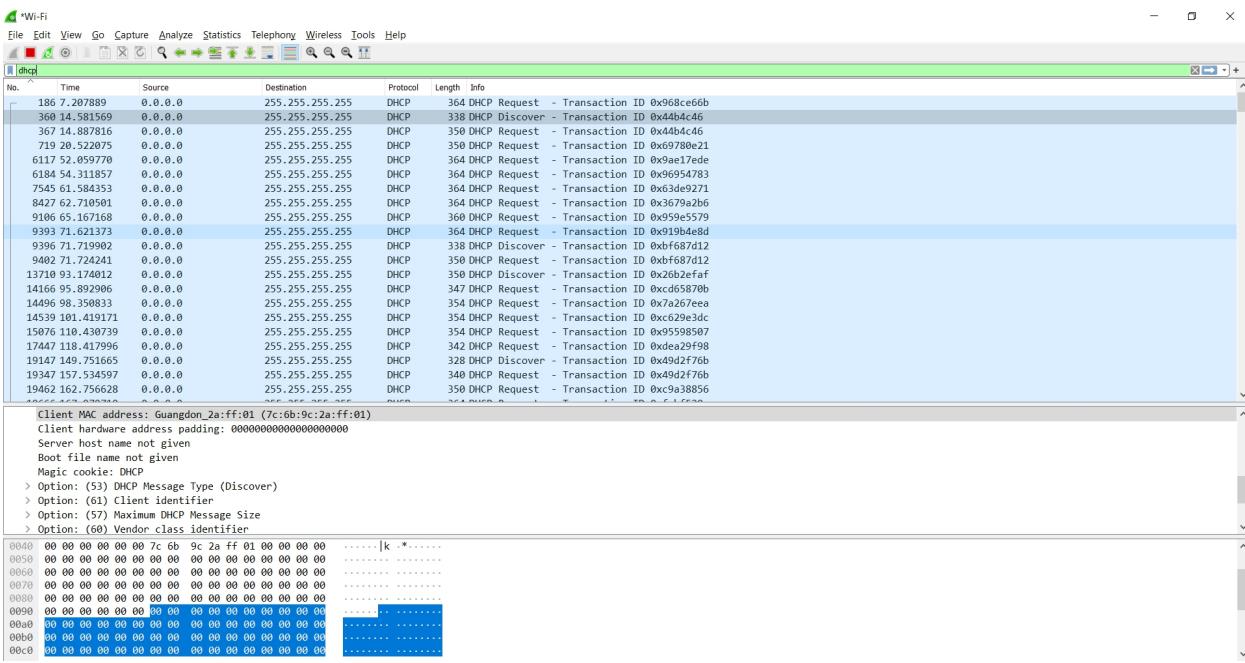

```

Frame 186: 364 bytes on wire (2912 bits), 364 bytes captured (2912 bits) on interface 'DeviceNPF_{65E0D34F-A32C-41C3-9D0A-F0337CC3669D}', id 0

## 7. ADVANTAGE AND DISADVANTAGES

### Advantages

- Broad Protocol Support: Ethernet, IP, TCP, UDP, HTTP, DNS, and a host of other network protocols are all supported by Wireshark. This makes it possible to analyse and comprehend network communications at all protocol stack layers in great detail.
- Real-time Packet Capture: With the help of Wireshark's real-time packet capture features, you may record and examine network data as it flows. This function is useful for identifying and resolving problems with live networks.
- Strong Analysis Tools: Wireshark provides a wide range of powerful analysis features. It enables you to examine specific packet information, carry out intricate filtering, examine protocol behaviour, produce statistics, make graphs, and even develop your own custom dissectors for proprietary protocols. These technologies make it possible to analyse network traffic in great detail and depth.
- Cross-platform Compatibility: Linux, macOS, and Windows are only a few of the operating systems for which Wireshark is available. Users may use Wireshark to do network analysis on their favourite operating system because to this cross-platform compatibility.
- Cost-effective: Since Wireshark is open-source and free software, there is no need to purchase pricey commercial network analysis tools. As a result, it is a cost-effective option for network research without sacrificing functionality.

### Disadvantages

- Resource Intensive: Analyzing large packet captures or performing in-depth analysis can be resource-intensive, requiring significant amounts of memory, processing power, and storage. Processing and

- analyzing extensive network traffic captures may strain system resources, leading to slower performance or potential limitations on the size of captures that can be effectively analyzed.
- Overwhelming Amount of Data: Wireshark captures and provides access to a vast amount of network traffic data. Analyzing and interpreting this data can be overwhelming, especially for novice users who may struggle to identify relevant packets or patterns amidst the sea of information.
- Complexity of Troubleshooting: While Wireshark provides valuable insights into network traffic, troubleshooting network issues solely based on packet-level analysis can be complex. Network problems can be caused by various factors beyond packet-level issues, including hardware failures, configuration errors, or external network conditions

## 8. APPLICATIONS

- Network Troubleshooting: Wireshark is frequently utilised to identify and resolve network problems. In order to locate the root of issues like network congestion, performance bottlenecks, connectivity problems, or misconfigurations, it enables you to capture and analyse network data. It assists in identifying the main cause of network outages and in finding effective solutions.
- Network infrastructure performance analysis and optimisation are made possible by Wireshark. Administrators can pinpoint areas where network performance can be enhanced by analysing network traffic patterns, packet loss, latency, and capacity utilisation. This includes improving network setups for better performance, identifying inefficient application behaviour, and optimising network protocols.
- Security Analysis: Wireshark is a useful tool for security experts to examine network traffic and spot threats or security weaknesses. It aids in the identification and investigation of network-based assaults such as network scanning, attempted intrusions, malware infections, or unauthorised access attempts. Wireshark can help with network monitoring and aberrant behaviour and pattern detection that may point to security or policy violations.
- Wireshark is a tool that is frequently used for protocol analysis and development. It enables programmers and academics to examine network protocol behaviour, examine packet-level information, and verify protocol compliance. The customisable dissectors and scripting features of Wireshark make it a useful tool for protocol designers and developers to analyse proprietary or bespoke protocols.
- VoIP Analysis: For analysing Voice over IP (VoIP) traffic, Wireshark offers specialised functionality and plugins. It enables VoIP engineers and administrators to record and examine SIP (Session Initiation Protocol) messages, RTP streams, call quality measurements, and signalling protocols. By assisting in VoIP deployment optimisation and debugging, Wireshark ensures high-quality audio connections.
- Network Forensics: Wireshark is used in network forensics to look into and examine security breaches or incidents involving networks. Reconstructing network activity, establishing the chronology of events, examining network-based evidence, and assembling data for incident response or legal processes are all made easier by this. Forensic analysis benefits from Wireshark's capacity to record and examine network traffic in real-time or from archived packet captures.
- Network Monitoring and Baseline Analysis: Continuous network monitoring and baseline analysis can be done with Wireshark. Administrators can define baseline behaviour, spot departures from typical network behaviour, and see trends or patterns in network usage by collecting and analysing network traffic over time. It helps with planning for capacity, spotting performance trends, and assuring network stability.

## **9. CONCLUSION**

In conclusion, Wireshark's use for network analysis at VIT College has given us in-depth understanding of how networks behave. We were able to resolve network problems, guarantee network security, and enhance overall network speed by looking at different protocols, analysing packet lengths, and observing DHCP DORA operations. The features of Wireshark have been crucial in helping the institution manage and maintain a reliable network infrastructure
